## 2. Citations and explanations (Rule 70.7)

1. This report makes reference to the following document:

D1, figure 2, which is regarded as the closest prior art, discloses a master-slave flip-flop switch arrangement in emitter coupled logic, in which arrangement switches Q1, Q4, Q7 and Q10, which are transversely controlled by the clock signal T, T, short circuit the associated ECL differential amplifier stages in a manner dependent on the state of the clock signal. The circuit according to D1 therefore likewise offers the advantage found in the application that a low supply voltage is possible because the transistors controlled by the clock signal do not switch the ECL current sources among ECL differential amplifiers.

The problem to be solved with respect to D1 is that of further reducing the amount of electricity required by the circuit (application, page 3, third paragraph).

Box No. V

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability;  
citations and explanations supporting such statement

According to the application, this can be done successfully if the four differential amplifiers of the two claimed flip flops have only two sources of current, whereby the initial stage of the one flip flop shares a current source with the cross-coupled stage of the other flip flop.

This feature is neither derivable from nor rendered obvious by the available prior art.

Therefore, the subject matter of claim 1 is novel (PCT Article 33(2)) and involves an inventive step (PCT Article 33(3)).

Claims 2 to 6 are dependent on claim 1 and therefore likewise meet the PCT requirements for novelty and inventive step.

Industrial applicability is established without a doubt.
